

3.00M SAILING DINGHY/TENDER

LOA 3.00M
BEAM 1.50M
EST. WEIGHT 33KGS

3.00m or 10 feet is a good small size for a dinghy capable of filling a number of roles. Used as a bigger tender for larger vessels, this dinghy has the proportions to take a considerable load. For those who want a small boat for recreational use, the same proportions make it a fun rowing, fishing and sailing craft.

Construction is strip planked with 6mm planking and light fabric laminates, with cold-moulding and lapstrake as alternates. The boat also makes for a good first-time project, being relatively straight forward to assemble. For people gaining experience before tackling a bigger project, the boat is also ideal as it features the basic details that go into building larger vessels.
